

## Are Rodents, Mice and Rats Dangerous to Humans' Healths? Can we use Bait Stations to eradicate them?aa

Rodents, such as mice and rats, can pose significant dangers to human health. These small mammals are known carriers of various diseases and can transmit pathogens through direct contact or contamination of food and water sources. One of the most notorious diseases associated with rodents is Hantavirus, which can be fatal to humans and is transmitted through their urine and droppings. Additionally, rodents can carry fleas and ticks, which can further transmit diseases like Lyme disease and typhus to humans.

Their gnawing habits can also damage structures, electrical wiring, and insulation, increasing the risk of fires and costly property damage. Furthermore, the allergenic proteins found in rodent hair, dander, and urine can trigger allergic reactions in sensitive individuals, leading to respiratory problems.

To protect human health, it's essential to prevent and control rodent infestations through proper sanitation, sealing entry points, and, if necessary, seeking professional pest control services. Vigilance and proactive measures are crucial in minimizing the health risks associated with rodents.

A "[rodent bait station](#)" is a device used to safely contain and dispense rodent baits, such as poison or traps, while keeping them out of reach of children, pets, and non-target animals. The "EZ" prefixes can be applied to this product to describe certain features:

**EZ Secured Rodent Bait Station:** Our EZ secured rodent bait station provides a safe and effective way to control mouse and rat infestations in your home.
