

Geladas, the bleeding-heart monkeys, are fascinating primates with unique facial features and massive canines. naa

This is an image of a gelada, a species of primate closely related to baboons. Known for their unique facial structure and large canine teeth, geladas are native to the Ethiopian highlands and have distinctive red patches on their chests, which is why they are sometimes called the "bleeding-heart monkey." Their massive canines are mainly for display rather than use, as they are primarily herbivores that feed on grasses.
