

# How the cold weather freezes the fish in place

Some of the fish are found upright, frozen in solid ice, as if they were in motion and preserved in this surreal scene. The phenomenon is likely caused by extremely cold weather conditions that rapidly freeze the water and trap the fish in place.

It is truly awe-inspiring and mesmerizing to witness the sight of fish frozen in the middle of a lake due to the harsh weather. In an astonishing moment, these creatures were trapped by the intense cold of winter, as temperatures plummeted to extreme lows, causing the water's surface to freeze instantly.
